

CORONATION OF KING OF ENGLAND

**Formal Announcement Made
With All Pomp and Ceremony
of Medieval Time**

**EVERY EUROPEAN COUNTRY
IS TO BE REPRESENTED**

**Work of Arranging for
Grand Ceremonial Being
Pushed With Vigor**

BY PAUL LAMBETH.

Special Cable to The Tribune.

LONDON, Aug. 13.—With the first announcement made, with all the pomp and circumstance of a coronation, the coronation of King George, to take place next June, the work of arranging the grand ceremonial affair will begin. And, with the coronation, there will be none too much time, for the work of the coronation of an English king is a task of no small magnitude. The king will be represented by the European courtiers, and the queen by the members of its royal family, of a kingdom; of a special embassy in the case of a republic, and of a special mission will be specially represented. Arrangements for the entertainment of the guests will be made, and the precedence will be settled, and the time of the coronation will be fixed, and the details of the pageant must be provided for. One of the first steps to be provided for is the arrangements for the coronation committee, which will commence at an early date to draw up suggestions for the arrangements for the function. The Duke of Norfolk, who is the Duke at the head of this committee. On

ably simplified because the coronation precedent. At the time of King Edward's accession it was otherwise, and many of the important governing the coronation ceremony were not forgotten. It must be remembered, it was necessary for the court of claims to sit and invest the titles to various rights and privileges which were claimed as the exclusive possession of the crown.

With many people hoping to attend who figured at the last ceremony of King, there will be a grand overabundance of robes and jewels that should serve again—precious, a marchioness's trimmings especially. A marchioness appeared at King Edward's crowning ceremony of the paraphernalia which great and small, and the coronation of a royal coronation, and it is quite

proper thing to come out in accordance with the customs of the possessions that suit the occasion. Since, everybody knows that the Tsar's crown is made of diamonds, and that the one which the father and grandmother used, altered, still fits the head, Queen Mary will probably wear the crown. Properly, the diamonds, with some poorer jewels to set out, as Queen Alexandra did. Perhaps the king's mother may decide to do as the queen did, and wear the crown of Marie Feodorovna, did in Russia, and the present czar was crowned. This is the most likely, but will be an innovation in Moscow, but will be an innovation in this country. The widows usually go in retirement. However, Queen Alexandra is so popular that she will not do so. In a few weeks' time England will be "invaded" by some 600 officers and their families. The Queen's Own Rifles of Canada, and their wives, are being brought to England, and will be accompanied by a commanding officer, Sir Henry Pellatt, at his own expense. They are to be entertained in the most comfortable manner, and they will be marched through London when they will be certain of a most enthusiastic reception. The Queen of Victoria's diamond jubilee has been seen the spectacle of imperial pomp.

from the empire's overseas dominions, and the British soil. And they will be remembered to have a large assortment of them. One too—once only—a regiment enlisted under an alien flag, marched proudly with drums beating and colors flying through the streets of England's capital. This was the Honourable Artillery company, which visited this country as the guard of the Honourable Artillery company in London. They were given a great reception by the English people, and were received at Windsor by the queen. Of course there have occurred many related instances of unauthorized foreign troops in the United Kingdom, for example some few years back

Postal Savings Bank. A pointer for the new United States Savings Bank is the fact that scores of obliging money men are now lying at the controller of the department at the general postoffice where they are submitted to be investigated by the public while the private accounts are placed there and to deposit at intervals at the postoffice. The bank is

will be dropped, through which the money will be at the bottom by means of which the postoffice authorities will be able to remove it. The boxes have to be made up in a manner that it will be impossible to open them without destroying the contents. They will be placed in the box. A receipt for three weeks will elapse before the "date" which is to be used is cited upon. Orders will be given to the manufacturer of 5000 boxes of the same pattern, which will be distributed after notification. The money will be put off for one year, some into it before next January. Some into a common return of the postoffice savings bank issued with the returns for prece-

years, we find a steady increase in deposits, a decrease in the amount of money withdrawn, and an increase of the balance due to deposits since 1906 or £8,600,000, making the total sum £144,600,000. The amount of money deposited in the National Reserve is the largest of any of the national reserve for a year.

The Jonathan Holt, the first mosquito-proof ocean-going steamer, arrived in the harbor of Port Moresby on the 11th of July. All the doors, windows and portholes are fitted with copper gauze to prevent the entry of the malaria-bearing insect.

One of the most picturesque figures at the Costers' Donkey show at the City Market is the "Peary King." His clothes were de-

A startling invention for illuminating the sea at night has been successfully tested by the Royal Admiralty at Port Albert, near Sydney. The device, which has been developed by the Admiralty experts who witnessed the operations. To the base of the gun is attached a powerful searchlight which can be directed in any desired screw movements, and the act of firing the gun causes a powerful illuminant to be projected in a fan-shaped beam throughout the whole of the trajectory of the missile, and is especially useful for illuminating the sea at night-time, both over sea and land. The device is also of value in showing the position of the vessel, and the waters of the Solent, it shot vertically upwards—a most surprising result. In many instances the light has been seen far to the left. The sight of a shell being hurled through the air and leaving a train
